Load Case1 - Guided Results

Safety Factor

With the analysis criteria in this study setup, there is opportunity to reduce the volume of material and cost of this design.

Next Steps

Above Safety Factor Limit

Validate your study setup

- Check the loads are not set too high
- Check the mesh refinement and consider increasing it in areas of high stress
- Confirm your Safety Factor requirement
- If the Displacement result shows high displacement, consider running a Nonlinear study to gain more insight

Check other results

- Examine the Below target Result visualization to see where the weakest areas are
- Check the stress result to see if, and where, the material might yield
- Check the displacement result to see how far from its original alignment the model has moved
- Look at other results, such as reaction forces to check your study set up, or strain to check your material performance

Safety Factor

Stress

Displacement

- Set a Safety Factor upper limit to find where material can be removed
- Remove material from areas that exceed the Safety Factor upper limit

Generate alternative designs

- In the Generative Design workspace, create design modifications
- Remove unnecessary material using a Shape Optimization study
